## **Customer:**

Okaz student activity in faculty of engineering.

## **Problem definition:**

Design web site for that activity for easily interactive with the borrower of the books and keep track this process.

## **Solution brief:**

1- Design an online Library allows the customers to borrow books and loan books to those who want.

2- Anyone who wants to add a book to the library just adds his name and phone number to easily communicate with him.

That data is stored in a database accessible just for the admins.

3- Books are classified by type like (historical - the novel - social - religious .... etc.). And recorded in database and be displayed in an easy way on the site.

4-Any of the users can borrow any book.

5- Admins of the site can see the borrowed books and the data of the borrower and lender users.
